1. Select the characteristic polynomial for the given matrix.

1/1 point

$$\begin{bmatrix} 2 & 1 \\ -3 & 6 \end{bmatrix}$$

$$\lambda^2 - 8\lambda - 1$$

$$\lambda^2 - 8\lambda + 15$$

$$\lambda^2 + 8\lambda + 15$$

$$\lambda^3 - 8\lambda + 15$$

⊘ Correct

Correct!
$$\lambda^2 - (2+6)\lambda + (2*6 - 1(-3)) = 0$$

2. Select the eigenvectors for the previous matrix in Q1, as given below:

1/1 point

$$\begin{bmatrix} 2 & 1 \\ -3 & 6 \end{bmatrix}$$

$$\bigcirc$$

$$\begin{pmatrix} 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

$$\begin{pmatrix} 1 \\ 3 \end{pmatrix}, \begin{pmatrix} 1 \\ 3 \end{pmatrix}$$

$$\begin{pmatrix} 1 \\ 3 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

0

$$\begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

✓ Correct

Correct! You first find the eigenvalues for the given matrix: $\lambda=5, \lambda=3$. Now you solve the equations using each of the eigenvalues.

For
$$\lambda=5$$
 , you have $egin{cases} 2x+y=5x \\ -3x+6y=5y \end{cases}$, which has solutions for $x=1,y=3$. Your eigenvector is $egin{pmatrix}1\\3 \end{pmatrix}$.

For
$$\lambda=3$$
 , you have $egin{cases} 2x+y=3x \\ -3x+6y=3y \end{cases}$, which has solutions for $x=1,y=1$. Your eigenvector is $egin{pmatrix} 1 \\ 1 \end{pmatrix}$.

3. Which of the following is an eigenvalue for the given identity matrix.

1/1 point

$$ID = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\bigcirc$$

$$\lambda = -1$$

 \bigcirc

 $\lambda = 2$

 $\lambda = 1$

⊘ Correct

Correct! The eigenvalue for the identity matrix is always 1.

4. Find the eigenvalues of matrix A·B where:

1/1 point

$$A = \begin{bmatrix} 1 & 2 \\ 0 & 4 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Hint: What type of matrix is B? Does it change the output when multiplied with A? If not, focus only on one of the matrices to find the eigenvalues.

$$\bigcirc$$

$$\lambda_1=4, \lambda_2=2$$

$$\lambda_1=3, \lambda_2=1$$

$$\lambda_1 = 4, \lambda_2 = 1$$

- C Eigenvalues cannot be determined.
 - ✓ Correct

Correct!

$$A\cdot B = \begin{bmatrix}1 & 2 \\ 0 & 4\end{bmatrix}\cdot\begin{bmatrix}1 & 0 \\ 0 & 1\end{bmatrix} = \begin{bmatrix}1\cdot 1 + 2\cdot 0 & 1\cdot 0 + 2\cdot 1 \\ 0\cdot 1 + 4\cdot 0 & 0\cdot 0 + 4\cdot 1\end{bmatrix} = \begin{bmatrix}1 & 2 \\ 0 & 4\end{bmatrix}$$

Since the second matrix is an identity matrix, you wouldn't need to solve the above multiplication since identity matrix does not change the result.

The eigenvalues of A are the roots of the characteristic equation $\det\left(A-\lambda\;I\right)=0.$

By solving $\lambda^2-5\lambda+4=0$, you get $\lambda_1=4,\lambda_2=1$.

5. Select the eigenvectors, using the eigenvalues you found for the above matrix 1/1 point A·B in Q2.

$$\vec{v_1}=(2,3); \vec{v_2}=(1,0)$$

$$\bigcirc$$

$$ec{v_1}=(2,3); ec{v_2}=(2,3)$$

$$\vec{v_1} = (2,0); \vec{v_2} = (1,0)$$

$$\vec{v_1} = (1,3); \vec{v_2} = (1,0)$$

⊘ Correct

Correct!

For
$$\lambda=4$$
 , you have $egin{cases} x+2y=4x \ 0x+4y=4y \end{cases}$, which has solutions for $x=2,y=3$. Your eigenvector $ec{v_1}$ is $egin{pmatrix} 2 \ 3 \end{pmatrix}$.

For
$$\lambda=1$$
 , you have $egin{cases} x+2y=x \\ 0x+4y=y \end{cases}$, which has solutions for $x=1,y=0$. Your eigenvector $ec{v_2}$ is $egin{pmatrix} 1 \\ 0 \end{pmatrix}$.

6. For which value of a (in real numbers) does the matrix have real eigenvalues?

1/1 point

$$\begin{bmatrix} 2 & a \\ -1 & 1 \end{bmatrix}$$

 \bigcirc

•

$$a \leq 1/4$$

C

0

$$a \ge 1/4$$

- **⊘** Correct!
- 7. Which of the vectors span the matrix $W=egin{bmatrix}2&3&0\\1&2&5\\3&-2&-1\end{bmatrix}$?

- $\bigcirc V1 = \begin{bmatrix} 2 \\ 3 \\ 0 \end{bmatrix} V2 = \begin{bmatrix} 1 \\ 2 \\ 5 \end{bmatrix} V3 = \begin{bmatrix} 3 \\ -2 \\ -1 \end{bmatrix}$
- - **⊘** Correct

Correct! There are linearly independent columns that span the matrix, which individually form three vectors $\vec{V_1}, \vec{V_2}, \vec{V_3}$. These vectors span the matrix W.

8. Given matrix P select the answer with the correct eigenbasis.

$$P = \begin{bmatrix} 2 & 0 & 0 \\ 1 & 2 & 1 \\ -1 & 0 & 1 \end{bmatrix}$$

Hint: First compute the eigenvalues, eigenvectors and contrust the eigenbasis matrix with the spanning eigenvectors.

$$Eigenbasis = egin{bmatrix} 0 & 0 & -1 \ -1 & 1 & 0 \ 1 & 0 & 1 \end{bmatrix}$$

$$egin{aligned} Eigenbasis = egin{bmatrix} 0 & -1 & 1 \ 0 & 1 & 0 \ -1 & 0 & 1 \end{bmatrix} \end{aligned}$$

$$egin{aligned} Eigenbasis = egin{bmatrix} 0 & 0 & 1 \ 0 & 1 & 0 \ 1 & 0 & 1 \end{bmatrix} \end{aligned}$$

(V) Correct

Correct! After solving the characteristic equations to find the eigenvalues, you should get $\lambda_1=1$ and $\lambda_2=2$.

The eigenvector for
$$\lambda_1=1$$
 is $ec{V_1}=egin{pmatrix}0\\-1\\1\end{pmatrix}$.

The eigenvectors for \lambda_2 = 2 are
$$ec{V_2}=egin{pmatrix}0\\1\\0\end{pmatrix}, ec{V_3}=egin{pmatrix}-1\\0\\1\end{pmatrix}$$
 .

The eigenvectors form the eigenbasis: $\begin{bmatrix} 0 & 0 & -1 \\ -1 & 1 & 0 \\ 1 & 0 & 1 \end{bmatrix}$

1/1 point

9. Select the characteristic polynomial for the given matrix.

$$\begin{bmatrix} 3 & 1 & -2 \\ 4 & 0 & 1 \\ 2 & 1 & -1 \end{bmatrix}$$

- $-\lambda^2 + 2\lambda^3 + 4\lambda 5$
- $-\lambda^3 + 2\lambda^2 + 9$
- $\bigcirc \qquad \qquad \lambda^3 + 2\lambda^2 + 4\lambda 5$
- - **⊘** Correct

Correct! The characteristic polynomial of a matrix A is given by $f(\lambda) = det(A - \lambda I)$.

First, you find the following:

$$\begin{bmatrix} 3 & 1 & -2 \\ 4 & 0 & 1 \\ 2 & 1 & -1 \end{bmatrix} \cdot \lambda \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

Now you compute the determinant of the result:

$$\det egin{pmatrix} 3-\lambda & 1 & -2 \ 4 & -\lambda & 1 \ 2 & 1 & -1-\lambda \end{pmatrix} = -\lambda^3 + 2\lambda^2 + 4\lambda - 5$$

10. You are given a non-singular matrix A with real entries and eigenvalue i.

1/1 point

Which of the following statements is correct?

- igodelight 1/i is an eigenvalue of A^{-1} .
- $\bigcirc \ i$ is an eigenvalue of $A^{-1} \cdot A \cdot I$.
- igcirc i is an eigenvalue of $A^{-1}+A$.
 - **⊘** Correct

Correct! You know that the eigenvalues of a matrix A are the solutions of its characteristic polynomial equation $det(A-\lambda I)=0$.
